

Volatility forecasting - HAR / HARQ / GBM / GBME(GBM+Earning) / GBME(GBM+Earning)+graph (all metrics, DM-bolded)

GBM = gamma-loss Gradient Boosting Machine on own-history features; GBME(GBM+Earning) = GBM + External earnings features; GBME(GBM+Earning)+graph adds the cross-firm correlation-graph neighbour aggregate. QLIKE is the primary loss (equal to the gamma deviance up to a constant); Diebold-Mariano tests use per-trading-date mean loss.

S&P 500

MSE $\times 10^{-7}$ - RMSE/MAE $\times 10^{-4}$ - QLIKE unscaled. **Bold** = QLIKE that is significantly best by date-clustered Diebold-Mariano ($p < 0.05$); MSE/RMSE/MAE carry no DM test and are not bolded.

h	Model	MSE	RMSE	MAE	QLIKE
1	HAR	5.754	7.586	2.132	0.3697
1	HARQ	5.648	7.515	2.151	0.3780
1	GBM	5.557	7.454	2.089	0.3570
1	GBME(GBM+Earning)	5.397	7.346	2.017	0.3172
1	GBME(GBM+Earning)+graph	5.424	7.365	2.010	0.3158
5	HAR	6.141	7.836	2.297	0.4364
5	HARQ	6.132	7.831	2.309	0.4377
5	GBM	6.117	7.821	2.255	0.4116
5	GBME(GBM+Earning)	5.972	7.728	2.180	0.3705
5	GBME(GBM+Earning)+graph	6.063	7.787	2.196	0.3715
10	HAR	6.214	7.883	2.356	0.4615
10	HARQ	6.205	7.877	2.358	0.4614
10	GBM	6.262	7.913	2.312	0.4307
10	GBME(GBM+Earning)	6.118	7.822	2.239	0.3912
10	GBME(GBM+Earning)+graph	6.240	7.899	2.272	0.3939
22	HAR	6.327	7.954	2.419	0.4855
22	HARQ	6.311	7.944	2.415	0.4831
22	GBM	6.233	7.895	2.359	0.4464
22	GBME(GBM+Earning)	6.098	7.809	2.277	0.4074
22	GBME(GBM+Earning)+graph	6.087	7.802	2.300	0.4110

DM: GBME(GBM+Earning) vs GBM h1 $p=0.000$ - GBME(GBM+Earning) vs GBM h5 $p=0.000$ - GBME(GBM+Earning) vs GBM h10 $p=0.000$ - GBME(GBM+Earning) vs GBM h22 $p=0.000$ (all significant $\rightarrow$ GBME(GBM+Earning) bolded; GBME(GBM+Earning)+graph does not significantly improve GBME(GBM+Earning), so graph is not bolded).

HOSE

MSE $\times 10^{-7}$ - RMSE/MAE $\times 10^{-4}$ - QLIKE unscaled. **Bold** = QLIKE that is significantly best by date-clustered Diebold-Mariano ($p < 0.05$); MSE/RMSE/MAE carry no DM test and are not bolded.

h	Model	MSE	RMSE	MAE	QLIKE
